Course name: Intelligence-Oriented Management Decision Systems

Homework assignment number: 7

Topic: log-periodic power laws (LPPL) for bubble modeling

Student name: 楊立愉 Student number: 0553410

題目一:

使用基因演算法代入 log-periodic power laws (LPPL) for bubble modeling,找到四個非線性解,並利用線性迴歸找到剩下三個線性解。

$$\log[p(t)] \approx A + B(t_c - t)^{\beta} \{1 + C\cos[\omega \times \log(t_c - t) + \phi]\}$$

Equation 1. log-periodic power laws (LPPL) for bubble modeling

實際資料:

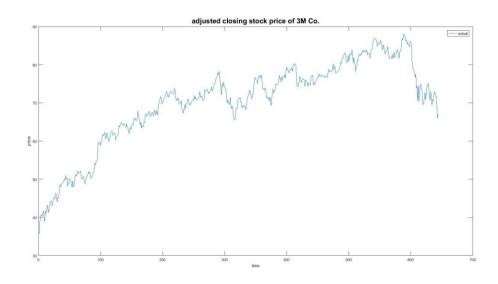

figure 1 實際資料

參數說明:

次經驗演算法

總量:10000、存活率:0.01、突變率:0.01、繁殖世代:10

LPPPL 假設

 $t_c = 550 \pm 32$

 $\beta = 0 \sim 1$ · 分成 1024 份

 $\omega = 0 \sim 492$

 $\phi = 0 \sim 2\pi$,分成 1024 份

產出結果:

 $t_c = 557$

 $\beta = 0.9990$

 $\omega = 2.7600$

 $\phi = 3.0189$

A = 4.5082

B = -0.0013

C = -0.4375

題目二:

將第一題所產出的最佳參數代入 LPPL·並與原始資料繪製再一起。

繪製結果:
